

TRACK ANYWHERE

Virtual Gate

Provides owners & contractors visibility of work performed in locations without boundaries.

Track Anywhere Virtual Gate

WHY MOBILE WORKFORCE MANAGEMENT?

Visibility of your Remote Workforce

Know what craftsman are on your worksite, their GPS coordinates, skills, rates & work schedules in real-time.

Accurate Costs Everyday

Get accurate hours & costs for each individual contractor working in remote locations.

Automatically Enforce Contracts

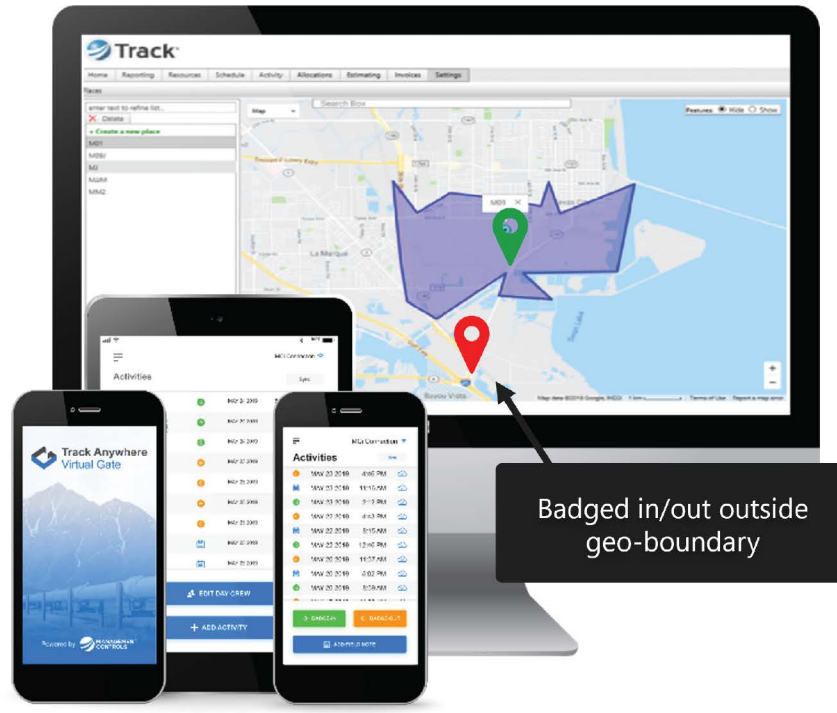

All contractor hours & costs are pre-audited & compliant to the Terms & Conditions of their unique contracts.

Contractor Management in the Field

Virtual Gate is the TRACK Platform's mobile solution that enables contractor in/out events to be captured in remote work locations. Virtual Gate consists of a mobile application (iPhone & Android) and an administrative console as a cloud application that communicates with the client's TRACK database. The application can be used by individuals or by a foreman to record the daily activity for their crew members.

With Virtual Gate, contractors can add field notes and images to provide owners visibility of the work being done in the field. All Virtual Gate activity includes GPS coordinates that are used with geo-boundaries and validation of worker location.

The activities from Virtual Gate flow into TRACK as labor activity along with the geo-information, field notes, and images giving owners information necessary to accurately approve.

iOS & Android Application

Foreman & Individual Modes

Virtual Gate has two different modes of usage - Foreman and Individual mode.

- Foreman mode enables the crew foreman to track the worksite activity for all crew members.
- Individual mode allows for individual workers to track all their worksite activity on their own. This includes badge in/out events and additional work related field notes & images.

True Visibility of Work Performed in the Field

Virtual gate keeps owners informed in real-time with work being performed in the field. Contractors input field notes & images of the work that has been done. When field notes & images are added into Virtual Gate, the GPS coordinates are recorded to show where the work is happening

Create Geo-Boundaries

Do you have assets that are spread across worksites?

Within TRACK, owners can create custom geo-boundaries that will confirm the location of contractor activity. When a contractor's activity from Virtual Gate are allocated to a cost object, TRACK approvers/authorizers will be notified whether the contractor was within or outside the predefined boundary.
