

HackerOne Hai

Faster Fixes. Smarter Insights. Better Security.

Turn Program Data into Power Moves

Every minute spent decoding reports or searching for patterns is a minute your assets remain exposed. While your security team races to keep pace with emerging threats, critical insights and opportunities for improvement often remain buried in mountains of program data.

Now, you can transform your vulnerability response workflow with Hai HackerOne's AI security agent. By combining advanced report analysis with program performance metrics, Hai quickly gives your team the power and intelligence to make faster, smarter decisions. From instant report comprehension to data illustration and detailed trend analysis, our AI-powered assistant helps you identify, prioritize, and resolve security challenges with unprecedented speed and precision.

“Hai has significantly reduced the time my team spends sifting through bug reports or creating responses, allowing us to focus more on resolving and communicating vulnerabilities quickly.”

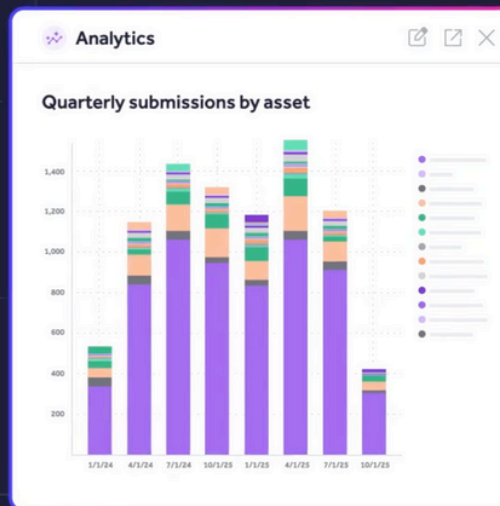

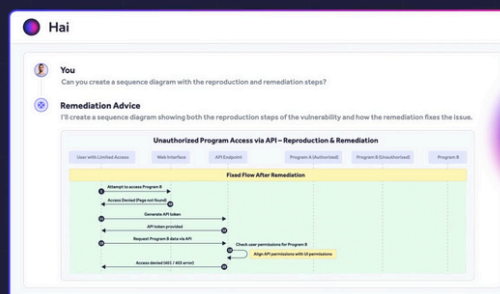

Alexander Hagenah,
Head of Cyber Controls, SIX Group

How it works

Conveniently embedded within your HackerOne workflow, Hai combines natural language understanding with program analytics to suggest actions and strategies that are based on your data. It transforms complex report details into clear explanations, surfaces performance trends, and highlight patterns that matter.

Hai improves with every report, learning from past activity and user input to stay aligned with evolving needs. It refines recommendations over time, helping you respond faster, prioritize more effectively, and stay focused on what matters.

Key Benefits

Clear Understanding

Transform complex reports and workflows into plain language and intuitive visualizations through chat. Hai simplifies technical details and puts data in context to reduce time searching and compiling.

Program Perspective

Track cross-program report metrics, spot patterns, and understand your brand's security trends through data-driven observations that guide practical improvements and new insights.

Accelerated Remediation

Fix vulnerability problems faster by bridging the communication gap between security teams, developers, and researchers with clear explanations and consistent terminology.

Streamlined SDLC

Elevate your SDLC, offering custom vulnerability scanner templates, API integrations, and dynamic automations for faster, more intelligent security processes.

Secure AI by Design

Hai is built to operate within the strictest security and privacy standards designed specifically for enterprise environments.

Maintain strict access controls

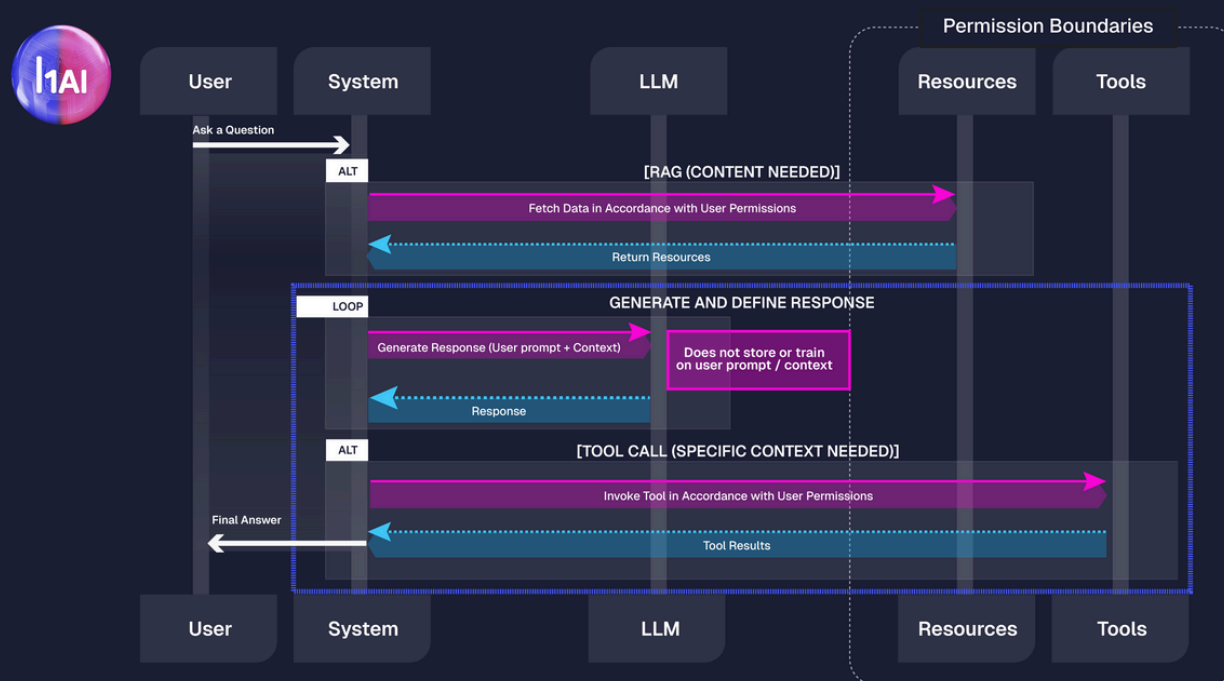

Only data the user is authorized to see is ever analyzed. Hai respects existing user-level permissions and never accesses information beyond what's allowed.

Keep data securely contained

All processing occurs within HackerOne's secure AWS environment. No external services are used, and your data never leaves the platform.

Quick insights, zero compromise

Get fast, AI-powered insights while maintaining full control over data privacy and compliance. Hai delivers value without introducing new exposure or complexity.

This diagram illustrates Hai's response flow, showing how user queries are processed through context retrieval, LLM invocation, and optional tool invocation, all within strict permission boundaries to ensure security and data integrity.
